Q8. What is bubbles vs composed in CustomEvent?

Detailed Explanation:

Component Tree: App (lightning__AppPage) ■■■ c-parent ■■■ c-child ← fires event bubbles: false, composed: false → event stays in c-child (parent can't hear it) bubbles: true, composed: false → bubbles through shadow DOM but stops at shadow boundary bubbles: true, composed: true → crosses shadow DOM, visible to any ancestor bubbles: false, composed: true → can cross shadow boundary but doesn't bubble ■ Best practice for parent-child communication: bubbles: false, composed: false — parent adds oneventname handler on the child element. Only use bubbles/composed: true for global broadcast patterns. ---

Detailed Explanation:

trigger OpportunityTrigger on Opportunity (after update) { List tasksToCreate = new List(); for (Opportunity opp : Trigger.new) { Opportunity oldOpp = Trigger.oldMap.get(opp.Id); if (opp.StageName == 'Closed Won' && oldOpp.StageName != 'Closed Won') { tasksToCreate.add(new Task(Subject = 'Follow up with customer post-close', WhatId = opp.Id, OwnerId = opp.OwnerId, ActivityDate = Date.today().addDays(30), Status = 'Not Started', Priority = 'Normal')); } } if (!tasksToCreate.isEmpty()) { insert tasksToCreate; } } ---

Q13. Scenario: You have 2 million Account records that need their Status__c field updated to 'Reviewed'. How do you approach this?

Detailed Explanation:

global class AccountStatusUpdateBatch implements Database.Batchable { global Database.QueryLocator start(Database.BatchableContext bc) { return Database.getQueryLocator([SELECT Id FROM Account WHERE Status__c != 'Reviewed']); } global void execute(Database.BatchableContext bc, List scope) { for (Account acc : scope) { acc.Status__c = 'Reviewed'; } Database.update(scope, false); // allOrNone=false: don't fail whole batch on 1 error } global void finish(Database.BatchableContext bc) { AsyncApexJob job = [SELECT Status, NumberOfErrors FROM AsyncApexJob WHERE Id = :bc.getJobId()]; System.debug('Batch complete. Errors: ' + job.NumberOfErrors); } } // Execute with 2000 batch size for DML efficiency Database.executeBatch(new AccountStatusUpdateBatch(), 2000); ---

Q14. Scenario: An integration calls your Salesforce REST endpoint 500 times per day to check if a specific Account's status changed. How do you optimize this?

Detailed Explanation:

Answer: Replace polling with Change Data Capture (CDC) or Platform Events: 1. Enable CDC for Account object 2. External system subscribes to AccountChangeEvent via Pub/Sub API / CometD 3. Salesforce pushes notification ONLY when Account changes 4. External system processes only changed records ■ Reduces 500 daily API calls to 0 polling, with near-real-time notification on actual changes. ---

• Discuss error handling and retries

Q15. Scenario: A trigger on Contact calls an external REST API to validate the email. However, you're getting "Callout not allowed after DML operations"

error. Why and how do you fix it?

Detailed Explanation:

Problem: DML runs first (triggering record save), then code tries callout in the same transaction. Fix: // Use @future(callout=true) or Queueable trigger ContactTrigger on Contact (after insert) { List contactIds = new List(); for (Contact c : Trigger.new) { if (c.Email != null) contactIds.add(c.Id); } if (!contactIds.isEmpty()) { ContactEmailValidator.validateEmails(contactIds); } } public class ContactEmailValidator { @future(callout=true) public static void validateEmails(List contactIds) { List contacts = [SELECT Id, Email FROM Contact WHERE Id IN :contactIds]; // Make callout here - no DML preceding in this new transaction context HttpRequest req = new HttpRequest(); // ... } } ---

Q16. Scenario: You notice that your batch job is running very slowly. The batch size is 200 and it processes 100K records. What would you investigate?

Detailed Explanation:

Checklist: 1. CPU governor limit: Reduce complex logic in execute(), pre-compute values 2. SOQL in execute(): Move to start() query or ensure no SOQL inside loops 3. DML efficiency: Are you collecting records and doing one DML? Or calling DML per record? 4. Batch size: Try 2,000 for simple operations (more records per execute = fewer transactions) 5. Database locks: High concurrency? Reduce batch size to 50 to reduce locking 6. Indexes: Is the WHERE clause in start() using indexed fields? ---

Q18. Scenario: How do you design a Salesforce integration with SAP that syncs Orders bidirectionally in near-real-time?

Detailed Explanation:

Architecture: Salesforce Order changes ↓ CDC event (OrderChangeEvent) → MuleSoft subscribes via Pub/Sub API → Transforms and sends to SAP via SAP connector SAP Order changes → MuleSoft detects via SAP event listener → Transforms to Salesforce format → Calls Salesforce REST API upsert (External ID = SAP Order Number) Key design decisions: - Use External ID (SAP_Order_Number__c) for idempotent upserts - Use MuleSoft for transformation and error handling - Dead letter queue for failed messages - Correlation ID for end-to-end tracing ---

Q19. Scenario: A validation rule is blocking data migration from a legacy system. How do you bypass validation rules during migration?

Detailed Explanation:

Options: 1. Deactivate validation rules → run migration → reactivate (simplest, risk of missed validation) 2. Custom Setting bypass: Add $CustomSetting.Migration_Mode__c check to all validation rules; set during migration 3. Permission-based bypass: $Permission.Data_Migration_Override custom permission check in validation rule; assign permission set to migration user 4. Data Loader / Bulk API: Validation rules still fire — no native bypass 5. Apex migration with without sharing: Sharing rules bypass but NOT validation rules ■ Best practice: Option 3 — custom permission bypass. Granular, auditable, reusable. ---

Q20. Scenario: Your Apex class is hitting the 100 SOQL limit. How do you diagnose and fix it?

Detailed Explanation:

// Diagnose - add to suspect areas: System.debug('SOQL queries used: ' + Limits.getQueries() + '/' + Limits.getLimitQueries()); // Common causes and fixes: // 1. SOQL inside for loop for (Account acc : accounts) { // BAD: Contact c = [SELECT ... WHERE AccountId = :acc.Id]; // GOOD: Use pre-queried map } // 2. Related list access in loop triggers lazy load for (Account acc : accounts) { // BAD: Integer count = acc.Contacts.size(); // hidden SOQL

per account // GOOD: Query with subquery in main SOQL } // 3. Multiple methods each querying same data // GOOD: Use Selector pattern, pass data as parameters instead of re-querying // Fix example: Map> contactsByAccount = new Map>(); for (Contact c : [SELECT Id, AccountId FROM Contact WHERE AccountId IN :accountIds]) { if (!contactsByAccount.containsKey(c.AccountId)) { contactsByAccount.put(c.AccountId, new List()); } contactsByAccount.get(c.AccountId).add(c); } --- Section C: Flow & Automation Scenarios

Q21. Scenario: When a Case is created and assigned to a Queue, automatically notify all queue members via email. No Apex.

Detailed Explanation:

Flow Design: 1. Record-Triggered Flow on Case — After Insert 2. Entry: OwnerId matches a Queue (use formula BEGINS({!$Record.Owner.Type}, 'Queue')) 3. Get Records: GroupMember where Group.Id = Case.OwnerId (Queue is a Group) 4. Loop through GroupMembers 5. Send Email to each member's email ■ Alternative simpler approach: Configure Queue settings to send email to all members when new record assigned. ---

Q23. Scenario: You want a business process where: (1) Sales rep marks Opp as Closed Won → (2) Billing creates Invoice → (3) Finance approves → (4) System sends contract. How do you implement this?

Detailed Explanation:

Answer: Flow Orchestration Orchestration: Post-Sale Process Stage 1 (Background): Record-Triggered Flow validates and flags Closed Won Stage 2 (Interactive): - Step: "Create Invoice" → assigned to Billing team queue Stage 3 (Interactive): - Step: "Finance Approval" → assigned to Finance Manager Stage 4 (Background): - Auto-launched Flow sends contract email ■ Alternatively: Approval Process for Finance step + Record-Triggered Flows for automation steps. ---

Q24. Scenario: A Record-Triggered Flow is causing infinite recursion. How do you debug and fix it?

Detailed Explanation:

Diagnosis: 1. Check Flow Trigger Explorer — look for loops 2. Enable debug log, reproduce, look for repeated flow executions 3. Check if flow updates a field that re-triggers the same flow Fix options: 1. Re-entry condition: Set to "Only the first time entry criteria are met" 2. State tracking field: Add Flow_Processed__c checkbox; set it in flow; add to entry criteria Flow_Processed__c = false 3. Change detection: Only run flow when specific field changes using {!$Record.Field} != {!$Record__Prior.Field} ---

Q25. Scenario: You need to calculate the total revenue of all Closed Won Opportunities for an Account and store it on the Account. No code.

Detailed Explanation:

Option 1 (Best): Roll-Up Summary - Create Master-Detail relationship between Opportunity and Account - Standard Opportunity has a Lookup to Account (not Master-Detail) - Problem: Cannot create Roll-Up Summary on Lookup Option 2: DLRS (Declarative Lookup Rollup Summaries) - AppExchange managed package enabling Roll-Up on Lookup relationships Option 3: Before-Save Flow on Opportunity - Trigger: Opportunity Before Save (Insert + Update + Delete) - Get all Closed Won Opps for Account - Sum Amount - Update Account via After-Save flow ■ Interview tip: Acknowledge the Lookup limitation, propose DLRS or Flow as alternatives. ---

Q26. Scenario: Your After-Save Flow is hitting "Too many DML rows: 10001" error during bulk import of 5,000 Accounts. Each Account flow creates 2 child records. 5,000 × 2 = 10,000. How do you fix this?

Detailed Explanation:

Root cause: Each flow interview runs separately. 5,000 accounts × 2 DML rows = 10,000 (right at limit). Adding any other DML in transaction pushes over. Solutions: 1. Batch the import: Import 4,500 accounts at a time (leaves room) 2. Use a Scheduled Flow instead: Post-import, scheduled flow processes records in smaller batches 3. Move to Apex Batch: Process child record creation in a batch job instead of flow 4. Reconsider design: Can child records be created differently (fewer per account)? ---

Q27. Scenario: You need a Screen Flow that adapts its fields based on the selected Account Record Type. How?

Detailed Explanation:

Design: 1. Screen 1: Combobox to select Record Type 2. Decision element: Check selected Record Type value 3. Branch to different Screens: - Branch A: Enterprise_Customer_RT → Show enterprise-specific fields - Branch B: SMB_Customer_RT → Show SMB-specific fields 4. Both branches merge → Final confirmation screen ■ For truly dynamic fields from getObjectInfo, use a custom LWC screen component instead. ---

Q28. Scenario: A Flow should send an email only ONCE when a Case is escalated, not every time it's updated while escalated. How?

Detailed Explanation:

Fix: Use Re-Entry condition or a tracking field. Approach: 1. Add custom checkbox Escalation_Email_Sent__c to Case 2. Entry criteria for flow: Priority = 'Critical' AND Escalation_Email_Sent__c = false 3. Flow actions: Send email + Update Case Escalation_Email_Sent__c = true ■ Now even if the case is updated 10 times while Critical, flow only runs the first time. --- Section D: LWC Scenarios

Advantages:

• Improves scalability

• Reduces manual work

• Enhances maintainability

• Supports enterprise-level implementation

Limitations:

• May have governor limits

• Requires optimization in large-scale orgs

• Security and sharing must be considered carefully

Real-Time Example:

A company using Salesforce can implement this feature to automate business operations, improve reporting, optimize customer management, or integrate external systems.

How to Explain in Interview:

• Start with definition

• Explain business use case

• Mention advantages and limitations

• Give a real-time example

Best Practice:

Always discuss performance optimization, scalability, security, and maintainability while answering.

LWC Interview Tips:

• Explain lifecycle hooks

• Compare @wire vs imperative calls

• Discuss LMS and LDS

• Mention performance optimization

Q31. Scenario: An LWC component is causing the page to be slow. How do you diagnose and fix performance issues?

Detailed Explanation:

Diagnosis steps: 1. Chrome Performance tab — record interaction, look for long tasks 2. Lightning Inspector — check component render count, data load time 3. Check renderedCallback — is it running too often or doing heavy work? 4. Check wire calls — are multiple wires firing on every re-render? 5. Check getters — are they doing expensive calculations called multiple times per render? Common fixes: ■■■

• Enhances maintainability

• Supports enterprise-level implementation

Limitations:

• May have governor limits

• Requires optimization in large-scale orgs

• Security and sharing must be considered carefully

LWC Interview Tips:

• Explain lifecycle hooks

• Compare @wire vs imperative calls

• Discuss LMS and LDS

• Mention performance optimization

Q32. Scenario: Your LWC @wire is not refreshing after a save operation. Why and how do you fix it?

Detailed Explanation:

Problem: LDS cache still has old data after imperative updateRecord() or Apex mutation. Fix: import { refreshApex } from '@salesforce/apex'; import { notifyRecordUpdateAvailable } from 'lightning/uiRecordApi'; // For

@wire(apexMethod) await refreshApex(this.wiredResult); // For @wire(getRecord) — LDS cache invalidation notifyRecordUpdateAvailable([{ recordId: this.recordId }]); // This causes all getRecord wires for this record to re-fetch

Q33. Scenario: Build a component that renders a list of 10,000 records efficiently.

Detailed Explanation:

Solution: Pagination or Virtual Scrolling PAGE_SIZE = 50; currentPage = 1; allRecords = []; get paginatedRecords() { const start = (this.currentPage - 1) * this.PAGE_SIZE; return this.allRecords.slice(start, start + this.PAGE_SIZE); } // OR use lightning-datatable with infinite loading: // Fetch 50 records at a time, load more on scroll ■ Never render all 10,000 records at once — browser performance collapses. Always paginate. ---

Q34. Scenario: How do you secure an LWC that displays sensitive financial data, ensuring users can only see data they're allowed to?

Detailed Explanation:

Layered approach: 1. Apex controller: Use with sharing to enforce sharing rules 2. FLS: Use WITH SECURITY_ENFORCED in SOQL or Security.stripInaccessible() 3. @AuraEnabled methods: Always use with sharing 4. Component targets: Restrict to specific profiles via Permission Sets 5. Never trust client-side data: All validation in Apex, not JS 6. URL params: Never pass sensitive data via URL parameters @AuraEnabled(cacheable=true) public static List getFinancialData(Id accountId) { // with sharing class — respects record-level security return Security.stripInaccessible(AccessType.READABLE, [SELECT Id, Amount__c, Account__c FROM Financial_Record__c WHERE Account__c = :accountId WITH SECURITY_ENFORCED]).getRecords(); } --- Section E: Integration Scenarios

Q35. Scenario: An external system needs to be notified whenever an Opportunity is marked Closed Won. Design the integration.

Detailed Explanation:

Recommended Architecture: Option A (Best - Event Driven): Opportunity Closed Won ↓ Record-Triggered Flow → Publish Platform Event: Opportunity_Won__e ↓ External System subscribes via Pub/Sub API or CometD → Processes event asynchronously Option B (Simpler - Direct callout): Opportunity Closed Won ↓ Record-Triggered Flow (After Save) → Call Apex @InvocableMethod ↓ Apex Queueable → HTTP callout to external system Why Option A: Decoupled, retry-capable (ReplayId), external system unavailability doesn't affect Salesforce. ---

Q36. Scenario: A nightly job needs to sync 500,000 Accounts from an ERP into Salesforce. Design this.

Detailed Explanation:

ERP exports 500K records as CSV (nightly at 2 AM) ↓ MuleSoft picks up file from S3/SFTP ↓ Splits into 10,000-record chunks ↓ Bulk API 2.0 upsert (External ID: ERP_Account_Id__c) ↓ Poll for job completion ↓ Download failed results CSV ↓ Create Integration_Error__c records for failures ↓ Alert ops team if error rate > 1% Why Bulk API 2.0: Designed for mass data, asynchronous, CSV-based, up to 100M records per day. ---

Q37. Scenario: A Salesforce user submits a form that triggers an external credit check. The response must come back synchronously within the same screen interaction. How?

Detailed Explanation:

Solution: Synchronous callout from Apex // LWC - imperative call (not cacheable, not wire) async handleSubmit() { this.isLoading = true; try { const result = await performCreditCheck({ accountId: this.recordId, amount: this.requestedAmount }); this.creditScore = result.score; this.isApproved = result.approved; } catch (error) { this.errorMessage = error.body.message; } finally { this.isLoading = false; } } @AuraEnabled public static CreditCheckResult performCreditCheck(Id accountId, Decimal amount) { // Synchronous HTTP callout HttpRequest req = new HttpRequest(); req.setEndpoint('callout:Credit_Bureau_API/check'); req.setMethod('POST'); req.setBody(JSON.serialize(new Map{ 'accountId' => accountId, 'amount' => amount })); HttpResponse res = new Http().send(req); return (CreditCheckResult) JSON.deserialize(res.getBody(), CreditCheckResult.class); } ■ Limit: Callout must complete within 30s (page timeout). Use loading spinner in LWC. ---

• Use trigger handler framework

• Avoid SOQL/DML inside loops

• Bulkify all logic

• Use recursion guards

Q38. Scenario: You're getting INSUFFICIENT_ACCESS errors when an API integration tries to update records. How do you troubleshoot?

Detailed Explanation:

Troubleshooting steps: 1. Check Connected App permissions — does the OAuth scope include api? 2. Check the user's profile used for integration — object-level CRUD permissions 3. Check FLS — is the field visible/editable for that profile? 4. Check OWD + Sharing — does the user own or have sharing access to the record? 5. Check record locking — is the record in an approval process? 6. Enable Debug Log for the integration user and reproduce the error 7. Check the error response body — it may specify which field/object caused the issue ---

• Mention Named Credentials

• Discuss error handling and retries

Q39. Scenario: How do you handle the scenario where Salesforce and an external system can both update the same record, and you want "last write

wins" vs "Salesforce always wins"?

Detailed Explanation:

"Last Write Wins": - Store LastModifiedDate (or a version field) in both systems - When syncing, compare timestamps - Accept the more recent change, overwrite the older "Salesforce Always Wins": - External system can only read from Salesforce (or suggest updates) - All updates go through Salesforce approval/validation - External system subscribes to CDC events but never pushes back changes Implementation: Add External_Last_Modified__c (DateTime) field. In integration: compare before updating, skip if Salesforce version is newer. ---
